Chapter 1

Namespace Index

1.1 Packages

Here are the packages with brief descriptions (if available):

csm6120	9
SearchAlgorithms	9
SearchTree	9

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

SearchAlgorithms.AStar	11
SearchAlgorithms.BFS	12
SearchAlgorithms.DFS	13
csm6120.FileManager	14
SearchAlgorithms.GBFS	14
SearchTree.Graph	15
csm6120.Main	17
SearchAlgorithms.ManhattanDistance	17
csm6120.State	21
SearchTree.TreeNode	24
Comparator	
SearchAlgorithms.StateComparator	23

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

SearchAlgorithms.AStar	11
SearchAlgorithms.BFS	12
SearchAlgorithms.DFS	13
csm6120.FileManager	14
SearchAlgorithms.GBFS	14
SearchTree.Graph	15
csm6120.Main	17
SearchAlgorithms.ManhattanDistance	17
csm6120.State	21
SearchAlgorithms.StateComparator	23
SearchTree.TreeNode	24

Chapter 4

File Index

4.1 File List

Here is a list of all files with brief descriptions:

C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/ FileManager.java	27
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/ Main.java	27
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/ State.java	27
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ AStar.java	28
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ BFS.java	28
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ DFS.java	28
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ GBFS.java	28
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ ManhattanDistance.java	29
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/ StateComparator.java	29
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchTree/ Graph.java	29
C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchTree/ TreeNode.java	29

Chapter 5

Namespace Documentation

5.1 Package csm6120

Classes

- class **FileManager**
- class **Main**
- class **State**

5.2 Package SearchAlgorithms

Classes

- class **AStar**
- class **BFS**
- class **DFS**
- class **GBFS**
- class **ManhattanDistance**
- class **StateComparator**

5.3 Package SearchTree

Classes

- class **Graph**
- class **TreeNode**

Chapter 6

Class Documentation

6.1 SearchAlgorithms.AStar Class Reference

Collaboration diagram for SearchAlgorithms.AStar:

Public Member Functions

- **AStar** ()
- void **astar** (**State** start, **State** goal)
- void **addNode** (**TreeNode** current, **State** goal)
- void **printPath** ()

6.1.1 Detailed Description

A* algorithm class

Author

Stefan

6.1.2 Constructor & Destructor Documentation

6.1.2.1 SearchAlgorithms.AStar.AStar ()

A* class constructor

6.1.3 Member Function Documentation

6.1.3.1 void SearchAlgorithms.AStar.addNode (*TreeNode current*, *State goal*)

Method to add a new node the the search queue. This method calculates the Manhattan Distance for every child in the current node and only add them to the search queue if the Manhattan Distance is less than the original calculated one.

Parameters

<i>current</i>	The current node
<i>goal</i>	The goal node, use for the Manhattan Distance calculation

6.1.3.2 void SearchAlgorithms.AStar.astar (State start, State goal)

A* algorithm

Parameters

<i>start</i>	The start State
<i>goal</i>	The goal State

6.1.3.3 void SearchAlgorithms.AStar.printPath ()

Prints the path from the start to the goal state of the puzzle

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**AStar.java**

6.2 SearchAlgorithms.BFS Class Reference

Collaboration diagram for SearchAlgorithms.BFS:

Public Member Functions

- **BFS** ()
- void **bfs** (State start, State goal)
- void **printPath** ()

6.2.1 Detailed Description

Class file for the Breadth first search algorithm

Author

stefan

6.2.2 Constructor & Destructor Documentation

6.2.2.1 SearchAlgorithms.BFS.BFS ()

Constructor of the **BFS** (p. 12) object

6.2.3 Member Function Documentation

6.2.3.1 void SearchAlgorithms.BFS.bfs (State start, State goal)

Breath-First search method

Parameters

<i>start</i>	The start State of the graph
<i>goal</i>	The goal State of the graph

6.2.3.2 void SearchAlgorithms.BFS.printPath ()

Prints the path from the start to the goal state of the puzzle

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**BFS.java**

6.3 SearchAlgorithms.DFS Class Reference

Collaboration diagram for SearchAlgorithms.DFS:

Public Member Functions

- **DFS** ()
- void **dfs** (**State** start, **State** goal)
- void **printPath** ()

6.3.1 Detailed Description

Depth-First search algorithm class

Author

stefan

6.3.2 Constructor & Destructor Documentation

6.3.2.1 SearchAlgorithms.DFS.DFS ()

Constructor of the **DFS** (p. 13) object

6.3.3 Member Function Documentation

6.3.3.1 void SearchAlgorithms.DFS.dfs (State start, State goal)

Depth-First Search algorithm

Parameters

<i>start</i>	The start state of the graph
<i>goal</i>	The goal state of the graph

6.3.3.2 void SearchAlgorithms.DFS.printPath ()

Prints the path from the start to the goal state of the puzzle

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**DFS.java**

6.4 csm6120.FileManager Class Reference

Public Member Functions

- **FileManager** ()
- void **reader** (**State** s, File path)
- void **findInteger** (String s, **State** state)

6.4.1 Detailed Description

This class holds methods to manipulate the input files.

Author

stefan

6.4.2 Constructor & Destructor Documentation

6.4.2.1 csm6120.FileManager.FileManager ()

Constructor of the **FileManager** (p. 14) class

6.4.3 Member Function Documentation

6.4.3.1 void csm6120.FileManager.findInteger (String s, State state)

Changes the input line from being Strings to single Integers.

Parameters

<i>s</i>	The String to analyse and change
<i>state</i>	The State (p. 21) object to save too

6.4.3.2 void csm6120.FileManager.reader (State s, File path)

Read a given file path and calls the **findInteger()** (p. 14) method. This is used to read the input files and read them line for line.

Parameters

<i>s</i>	The State (p. 21) object to save too
<i>path</i>	The path of the input file

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/**FileManager.java**

6.5 SearchAlgorithms.GBFS Class Reference

Collaboration diagram for SearchAlgorithms.GBFS:

Public Member Functions

- **GBFS** ()
- void **gbfs** (**State** start, **State** goal)
- void **printPath** ()

6.5.1 Detailed Description

Greedy Best-First Search class

Author

stefan

6.5.2 Constructor & Destructor Documentation

6.5.2.1 SearchAlgorithms.GBFS.GBFS ()

Constructor of the **GBFS** (p. 14) class

6.5.3 Member Function Documentation

6.5.3.1 void SearchAlgorithms.GBFS.gbfs (**State** start, **State** goal)

Greedy Best-First Search algorithm

Parameters

<i>start</i>	The start State of the graph
<i>goal</i>	The goal State of the graph

6.5.3.2 void SearchAlgorithms.GBFS.printPath ()

Prints the path from the start to the goal state of the puzzle

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**GBFS.java**

6.6 SearchTree.Graph Class Reference

Public Member Functions

- **Graph** ()
- void **nextStep** (**TreeNode** s)
- void **corner** (int tile, **TreeNode** s)
- void **midSection** (int tile, **TreeNode** s)
- void **center** (int tile, **TreeNode** s)

6.6.1 Detailed Description

This class is used to generate the next step in the graph.

Author

Stefan

6.6.2 Constructor & Destructor Documentation

6.6.2.1 SearchTree.Graph.Graph ()

Constructor for the graph object

6.6.3 Member Function Documentation

6.6.3.1 void SearchTree.Graph.center (int *tile*, **TreeNode** *s*)

This method generates the next level of the graph if the empty tile(0) is in the center of the puzzle. (Tile 4 in the representation below Saves all possible states to an arrayList.

0 1 2 3 4 5 6 7 8

Parameters

<i>tile</i>	The index of the empty tile
<i>s</i>	The state to base algorithm on

6.6.3.2 void SearchTree.Graph.corner (int *tile*, **TreeNode** *s*)

This method is used to generate the next level of the graph when the empty tile is at a corner. Saves all changes to a arrayList of possible states. The tiles where this method is used corresponds with the fields 0, 2, 6 ,and 8 as shown below

0 1 2 3 4 5 6 7 8

Parameters

<i>tile</i>	The index of the empty tile(0)
<i>s</i>	The state to base algorithm on

6.6.3.3 void SearchTree.Graph.midSection (int *tile*, **TreeNode** *s*)

This method to generate the next level of the graph when the empty tile(0) is on the midsection of the sides. Saves all possible states to an arrayList. The tiles where this method will be used correspond to the fields 1, 3, 5, and 7 as shown below

0 1 2 3 4 5 6 7 8

Parameters

<i>tile</i>	The index of the empty tile(0)
<i>s</i>	The state to base algorithm on

6.6.3.4 void SearchTree.Graph.nextStep (**TreeNode** *s*)

Algorithm to generate the next state in the graph Based on the fact that empty space can only move horizontally and vertically. To make the process easier simple numbers identifiers are assigned to the possible tiles in the puzzle. These numbers represent indices in the arrayList and are : 0 1 2 3 4 5 6 7 8 This method checks where the empty tile is and calls other methods to switch the tiles.

Parameters

<i>s</i>	The state on which the next step will be based
----------	--

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchTree/**Graph.java**

6.7 csm6120.Main Class Reference

Static Public Member Functions

- static void **main** (String[] args)

6.7.1 Detailed Description

This class is the entrance to the program.

Author

stefan

6.7.2 Member Function Documentation

6.7.2.1 static void csm6120.Main.main (String[] *args*) [static]

Main (p. 17) method of the program. This method can be called from the command line with a set of arguments.

javac main theStartFile theGoalFile theAlgorithmToUse

where theStartFile is a text file holding the start **State** (p. 21), theGoalFile holds the goal **State** (p. 21) of the puzzle. TheAlgorithmToUse specifies which algorithm, possibilities are:

bfs - Breadth-First search dfs - Depth-First search gbfs - Greedy Best-First search astar - A* search

Parameters

<i>args</i>	the command line arguments
-------------	----------------------------

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/**Main.java**

6.8 SearchAlgorithms.ManhattanDistance Class Reference

Public Member Functions

- **ManhattanDistance** (State start, State goal)
- int[] **convertToArray** (ArrayList< Integer > i)
- int[][] **convertTo2DArray** (int[] intArray)
- void **setStartArray** (int[][] toSet)
- void **setGoalArray** (int[][] toSet)
- int[][] **findCell** (int[][] array, int index)
- int **findXCoordinate** (int[][] array, int index)
- int **findYCoordinate** (int[][] array, int index)
- int **calcManhattanDistance** (State start, State goal)

6.8.1 Detailed Description

This class is used to calculate the Manhattan distance for the A* algorithm

Author

Stefan

6.8.2 Constructor & Destructor Documentation

6.8.2.1 SearchAlgorithms.ManhattanDistance.ManhattanDistance (State start, State goal)

Constructor of the **ManhattanDistance** (p. 17) class

Parameters

<i>start</i>	The State to compare to the goal
<i>goal</i>	The goal State to compare too

6.8.3 Member Function Documentation

6.8.3.1 int SearchAlgorithms.ManhattanDistance.calcManhattanDistance (State start, State goal)

Calculate the Manhattan distance for 2 input states

Parameters

<i>start</i>	The start State for the calculation
<i>goal</i>	The goal State to calculate the distance to

Returns

An integer representing the Manhattan Distance;

6.8.3.2 int [][] SearchAlgorithms.ManhattanDistance.convertTo2DArray (int[] intArray)

Method to convert an 1D integer array to a 2D integer array

Parameters

<i>intArray</i>	The integer array to convert
-----------------	------------------------------

Returns

An 2D integer array

6.8.3.3 int [] SearchAlgorithms.ManhattanDistance.convertToArray (ArrayList< Integer > i)

Method to convert an ArrayList to an array

Parameters

<i>i</i>	The arrayList to convert
----------	--------------------------

Returns

An integer array

6.8.3.4 `int [][] SearchAlgorithms.ManhattanDistance.findCell (int array[][], int index)`

Method to find the X and Y coordinates of a given tile in a 2D array

Parameters

<i>array</i>	The 2D array to search in
<i>index</i>	The number/tile to search for

Returns

A 2D array holding the X and Y coordinates

6.8.3.5 `int SearchAlgorithms.ManhattanDistance.findXCoordinate (int array[[]], int index)`

Method to find the X coordinates of a given tile in a 2D array

Parameters

<i>array</i>	The 2D array to search through
<i>index</i>	The number/tile to search for

Returns

An integer value representing the X coordinate in a 2d Array

6.8.3.6 `int SearchAlgorithms.ManhattanDistance.findYCoordinate (int array[[]], int index)`

Method to find the Y coordinates of a given tile in a 2D array

Parameters

<i>array</i>	The 2D array to search through
<i>index</i>	The number/tile to search for

Returns

An integer value representing the Y coordinate in a 2d Array

6.8.3.7 `void SearchAlgorithms.ManhattanDistance.setGoalArray (int toSet[[]])`

Method to set the goalArray

Parameters

<i>toSet</i>	2D array to set too
--------------	---------------------

6.8.3.8 `void SearchAlgorithms.ManhattanDistance.setStartArray (int toSet[[]])`

Method to set the startArray

Parameters

<i>toSet</i>	2D array to set too
--------------	---------------------

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**ManhattanDistance**.↔
java

6.9 csm6120.State Class Reference

Public Member Functions

- **State** ()
- **State** (**State** s)
- void **addState** (int toAdd)
- void **printArray** ()
- int **returnIndex** (int i)
- void **changeTiles** (int i, int j)
- ArrayList **clone** ()
- boolean **compare** (**State** s)
- String **getStringToString** ()
- int **compareMatching** (**State** s)
- int **getArraySize** ()
- ArrayList **getStateArray** ()

6.9.1 Detailed Description

This class has methods and variables to hold an input state. This will be used to hold the start and goal state object.

Author

stefan

6.9.2 Constructor & Destructor Documentation

6.9.2.1 csm6120.State.State ()

Constructor for the **State** (p. 21) object creates an empty arrayList in which the state data will be saved

6.9.2.2 csm6120.State.State (**State** s)

Constructor for the **State** (p. 21) object creates a deep clone of the state object which is specified in the parameter field

Parameters

<i>s</i>	The state to clone
----------	--------------------

6.9.3 Member Function Documentation

6.9.3.1 void csm6120.State.addState (int *toAdd*)

Method to add an integer to the arrayList

Parameters

<i>toAdd</i>	The integer to add
--------------	--------------------

6.9.3.2 void csm6120.State.changeTiles (int *i*, int *j*)

Method to exchange to tiles

Parameters

<i>i</i>	Index of the tile to change
<i>j</i>	Index of the Empty tile to change

6.9.3.3 ArrayList csm6120.State.clone ()

This method clones the arrayList and returns it

Returns

The cloned arrayList

6.9.3.4 boolean csm6120.State.compare (State s)

Method to compare this object to another state object

Parameters

<i>s</i>	The state to compare too
----------	--------------------------

Returns

True if the states are the same, false if not

6.9.3.5 int csm6120.State.compareMatching (State s)

Method to return how many integers in this object compared to another object match

Parameters

<i>s</i>	The state to compare too
----------	--------------------------

Returns

The number of matching ints

6.9.3.6 int csm6120.State.getArraySize ()

Method to return the size of the state array

Returns

int value of the state array size

6.9.3.7 ArrayList csm6120.State.getStateArray ()

Method to return the state ArrayList

Returns

The state ArrayList

6.9.3.8 String csm6120.State.getStringToString ()

Method to return the string representation of the "state" ArrayList

Returns

The toString representation of the "state" ArrayList

6.9.3.9 void csm6120.State.printArray ()

Print the ArrayList

6.9.3.10 int csm6120.State.returnIndex (int *i*)

Method to return the index of a specific item in the ArrayList

Parameters

<i>i</i>	The item to search for
----------	------------------------

Returns

The position of the item in the ArrayList

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/csm6120/**State.java**

6.10 SearchAlgorithms.StateComparator Class Reference

Inheritance diagram for SearchAlgorithms.StateComparator:

Collaboration diagram for SearchAlgorithms.StateComparator:

Public Member Functions

- int **compare** (TreeNode o1, TreeNode o2)

6.10.1 Detailed Description

This class is used to compare to states together. Implements the Comparator interface

Author

Stefan

6.10.2 Member Function Documentation**6.10.2.1 int SearchAlgorithms.StateComparator.compare (TreeNode o1, TreeNode o2)**

Method to compare 2 TreeNode objects for order. Compares 2 objects state string representation and orders them based on their natural ordering i.e. 0 1 2 3 4 5 6 7 8

Parameters

<i>o1</i>	TreeNode object 1 to compare
<i>o2</i>	TreeNode object 2 to compare

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second

The documentation for this class was generated from the following file:

- C:/Users/Stefan/Documents/GitHub/CSM6120_Assignment2/src/SearchAlgorithms/**StateComparator.java**

6.11 SearchTree.TreeNode Class Reference

Public Member Functions

- **TreeNode** (State s)
- **TreeNode** (TreeNode t)
- void **addChild** (TreeNode child)
- void **addSibling** (TreeNode sibling)
- **State** **getState** ()
- **TreeNode** **getFirstChild** ()
- **TreeNode** **getFirstSibling** ()
- boolean **siblingsEmpty** ()
- boolean **childrenIsEmpty** ()
- **TreeNode** **peekChild** ()
- void **removeFirstChild** ()
- void **setExplored** (boolean b)
- boolean **getExplored** ()
- int **getNumOfChildren** ()

6.11.1 Detailed Description

This class represents a node in the search tree/graph

Author

stefan

6.11.2 Constructor & Destructor Documentation

6.11.2.1 SearchTree.TreeNode.TreeNode (State s)

Constructor of the **TreeNode** (p. 24) class. Creates a deep copy of the state which is passed as parameter Initialises the linkedLists.

Parameters

<i>s</i>	The State the node refers too
----------	-------------------------------

6.11.2.2 SearchTree.TreeNode.TreeNode (TreeNode t)

Constructor of the **TreeNode** (p. 24) class. Creates a deep copy of another **TreeNode** (p. 24) object.

Parameters

<i>t</i>	The TreeNode (p. 24) object this instance is a copy off
----------	--

6.11.3 Member Function Documentation

6.11.3.1 void SearchTree.TreeNode.addChild (**TreeNode** *child*)

Method to add a child to the linkedList

Parameters

<i>child</i>	The TreeNode (p. 24) object to add to the children list
--------------	--

6.11.3.2 void SearchTree.TreeNode.addSibling (**TreeNode** *sibling*)

Method to add a sibling to the linkedList of siblings

Parameters

<i>sibling</i>	The TreeNode (p. 24) object to add to the siblings list
----------------	--

6.11.3.3 boolean SearchTree.TreeNode.childrenIsEmpty ()

Method to check if the **TreeNode** (p. 24) object has children. Returns true if the linkedList is empty

Returns

Boolean "True" if the list is empty

6.11.3.4 boolean SearchTree.TreeNode.getExplored ()

Method to get the "explored" variable of the object

Returns

The boolean value of "explored"

6.11.3.5 **TreeNode** SearchTree.TreeNode.getFirstChild ()

Method to return(poll) and remove the first element of the "Children" linkedList

Returns

The head of the "children" linkedList

6.11.3.6 **TreeNode** SearchTree.TreeNode.getFirstSibling ()

Method to return(poll) and remove the first element of the "siblings" linkedList

Returns

The head of the "siblings" linkedList

6.11.3.7 `int SearchTree.TreeNode.getNumOfChildren ()`

Method to return the size of the "children" linkedList

Returns

The size of the List

6.11.3.8 `State SearchTree.TreeNode.getState ()`

Method to return the state of the node object

Returns

the State object of the node

6.11.3.9 `TreeNode SearchTree.TreeNode.peekChild ()`

Method to peek(return but not remove) the head of the "children" linkedList

Returns

The head of the "children" LinkedList

6.11.3.10 `void SearchTree.TreeNode.removeFirstChild ()`

Method to remove the head of the children linkedList

6.11.3.11 `void SearchTree.TreeNode.setExplored (boolean b)`

Method to set the "explored" variable of the object

Parameters

<i>b</i>	The boolean value to set
----------	--------------------------

6.11.3.12 `boolean SearchTree.TreeNode.siblingsEmpty ()`

Method to check if the **TreeNode** (p. 24) object has siblings. Returns true if the linkedList is empty

Returns

Boolean "True" if the list is empty

The documentation for this class was generated from the following file:
